# The curvature and dimension of a closed surface

S. Halayka\*

October 8, 2019

#### Abstract

The curvature of a closed surface can lead to fractional dimension. In this paper, the properties of the 2-sphere surface of a three-dimensional ball and the 2.x-dimensional surface of a three-dimensional fractal set are considered. Tessellation is used to approximate each surface, primarily because the 2.x-dimensional surface of a three-dimensional fractal set is otherwise non-differentiable (having no well-defined surface normals).

## 1 Overview

Unlike in traditional geometry where dimension is an integer, fractional (non-integer) dimension occurs in *fractal* geometry. In fractal geometry, there are currently many ways to calculate the dimension of a surface [1, 2]. This paper uses a new method of calculating the fractional dimension of a surface – it is *curvature* that leads to this fractional dimension.

In this paper we will focus on the tessellation of closed surfaces. For instance, Marching Cubes [3, 4] can be used to generate 2.x-dimensional triangular tessellations (meshes), where dimension  $D \in (2.0, 3.0)$ .

We will focus on the difference between the curvature and dimension of a 2-sphere and the 2.x-dimensional surface of a three-dimensional fractal set. We will generate both a 2-sphere and the 2.x-dimensional surface of a three-dimensional fractal set by using iterative quaternion equations. For example, a 2-sphere is generated from the iterative quaternion Julia set equation  $Z = Z^2 + C$ , but where C = 0.0, 0.0, 0.0, 0.0, and the 2.x-dimensional surface of a three-dimensional fractal set is generated from the iterative quaternion equation  $Z = Z \cos(Z)$ . See [5] for information on how to perform quaternion multiplication, addition, cos, etc.

# 2 The tessellation of a closed surface

Approximating the surface of a three-dimensional shape as a mesh allows us to calculate the surface's dimension  $D \in (2.0, 3.0)$ . This includes approximation of both a 2-sphere and the 2.x-dimensional surface of a three-dimensional fractal set.

<sup>\*</sup>sjhalayka@gmail.com

First we calculate, for each triangle, the average dot product of the triangle's face normal  $\hat{n}_i$  and its three neighbouring triangles' face normals  $\hat{o}_1$ ,  $\hat{o}_2$ ,  $\hat{o}_3$ :

$$d_i = \frac{\hat{n}_i \cdot \hat{o}_1 + \hat{n}_i \cdot \hat{o}_2 + \hat{n}_i \cdot \hat{o}_3}{3} \in (-1.0, 1.0]. \tag{1}$$

Because we assume that there are three neighbours per triangle, the mesh must be *closed* (no cracks or holes, precisely two triangles per edge). The reasion why the value -1.0 is not achievable is because that would lead to intersecting triangles.

Then we calculate the normalized measure of curvature:

$$k_i = \frac{1 - d_i}{2} \in [0.0, 1.0).$$
 (2)

Once  $k_i$  has been calculated for all triangles, we can then calculate the average normalized measure of curvature K, where t is the number of triangles in the mesh:

$$K = \frac{1}{t} \sum_{i=1}^{t} k_i = \frac{k_1 + k_2 + \dots + k_t}{t} \in (0.0, 1.0).$$
 (3)

The reason why the value 0.0 is not achievable is because we are dealing with a closed surface, and so there's bound to be *some* curvature.

The dimension of the closed surface is:

$$D = 2 + K \in (2.0, 3.0). \tag{4}$$

As far as we know, this method of calculating the dimension of a closed surface is new [6, 7]. The entire C++ code for generating a mesh can be found at [8]. The entire C++ code for calculating a mesh's dimension can be found at [9].

# 3 Vanishing versus non-vanishing curvature

Where  $r \in [2, \infty)$  is the *integer* sampling resolution,  $g_{\text{max}} \in (-\infty, \infty)$  is the sampling grid maximum extent,  $g_{\text{min}} \in (-\infty, \infty)$  is the sampling grid minimum extent, and  $g_{\text{max}} > g_{\text{min}}$ , the Marching Cubes step size is:

$$\ell = \frac{g_{\text{max}} - g_{\text{min}}}{r - 1} \in (0.0, \infty). \tag{5}$$

In this paper  $g_{\text{max}} = 1.5$ ,  $g_{\text{min}} = -1.5$ , and r is variable.

For a 2-sphere, the *local* curvature all but vanishes as  $\ell$  decreases (as r increases):

$$\lim_{\ell \to 0.0} K(\ell) = 0.0. \tag{6}$$

This results in a dimension of practically (but never quite) 2.0, which is to be expected from a non-fractal surface. See Figures 1 - 3.

On the other hand, for the 2.x-dimensional surface of a three-dimensional fractal set, the local curvature does not vanish as  $\ell$  decreases:

$$\lim_{\ell \to 0.0} K(\ell) \neq 0.0. \tag{7}$$

This results in a dimension considerably greater than 2.0, but not equal to or greater than 3.0, which is to be expected from a fractal surface. See Figures 4 - 7.

### 4 Notes

The minimum Marching Cubes step size, in real life, is the Planck length  $\ell_P$ .

Marching Squares [10, 11, 12] can be used to generate 1.x-dimensional closed line paths, where dimension  $D \in (1.0, 2.0)$ . See Figures 8 - 10 for some examples of a line path. These figures might be helpful if there is difficulty envisioning the curvature in the case of Marching Cubes.

Figure 1: Low resolution (r = 10) surface for the iterative quaternion equation is  $Z = Z^2$ . The surface's dimension is 2.02.

Figure 2: Medium resolution (r=100) surface for the iterative quaternion equation is  $Z=Z^2$ . The surface's dimension is 2.06.

Figure 3: High resolution (r = 1000) surface for the iterative quaternion equation is  $Z = Z^2$ . The surface's dimension is practically 2.0.

Figure 4: Low resolution (r=10) surface for the iterative quaternion equation is  $Z=Z\cos(Z)$ . The surface's dimension is 2.05.

Figure 5: Medium resolution (r=100) surface for the iterative quaternion equation is  $Z=Z\cos(Z)$ . The surface's dimension is 2.11.

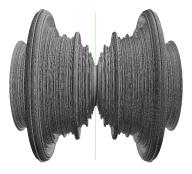

Figure 6: High resolution (r=1000) surface for the iterative quaternion equation is  $Z=Z\cos(Z)$ . The surface's dimension is 2.08.

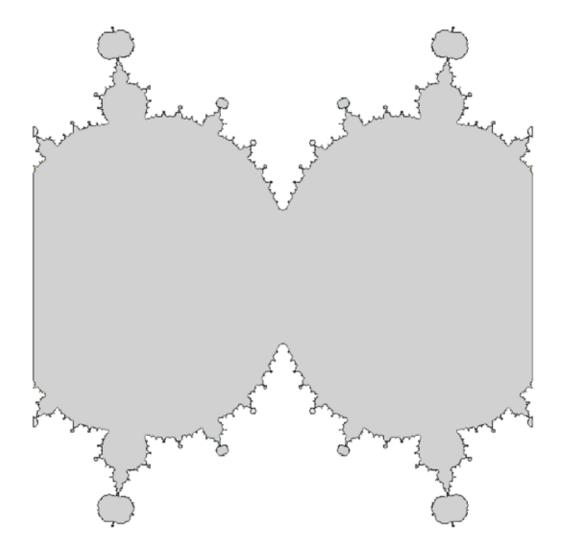

Figure 7: A two-dimensional slice of the iterative quaternion equation  $Z=Z\cos(Z)$ , showing the fractal nature of the set.

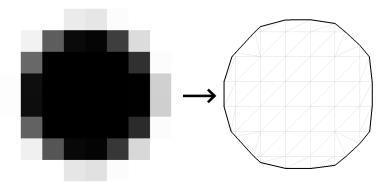

Figure 8: Example input (a two-dimensional greyscale image, consisting of pixels) and output (a 1.x-dimensional closed set of line segments) of the Marching Squares algorithm, approximating a 1-sphere (a circle), where sampling resolution is r=8. Note that for Marching Cubes, the input is a three-dimensional 'greyscale image', consisting of voxels, and the output is a 2.x-dimensional closed set of triangles.

Figure 9: Illustrated is a section of a closed line path, with surface normals. The average dot product of neighbouring line segments is  $d_i = 0.0$ . This leads to a normalized measure of curvature  $k_i = (1 - d_i)/2 = 0.5$ , which in turn leads to an average normalized measure of curvature K = 0.5. The dimension is D = 1 + K = 1.5.

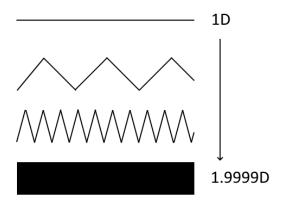

Figure 10: A section of a closed line path as it goes from dimension 1.0 (at top) to 1.9999 (at bottom). In the end, where the dimension is 1.9999, the result is practically a rectangle. The reason why the dimension cannot be 2.0 is because that would lead to intersecting line segments.
